Will Murray's Probability, XXXIV. Sampling from a Normal Population 1

XXXIV. Sampling from a Normal Population

Setting

- We have a population of stuff, e.g. students of different heights.
- The population has a mean μ and variance σ^2 .
- We will take samples: Y₁ := height of one student. Y₂ := height of another, and so on.
 Y_n := height of last sample student.

Assumptions and Notation

- Assumption forever: Our samples are independent.
- We say the Y_i are independent identically distributed (i.i.d.) random variables.
- Assumption for this lecture only: The population is normally distributed.
- Notation: We say $Y_i \sim N(\mu, \sigma^2)$.

The Sample Mean

• Statistic we'll study: The sample mean $\overline{Y} := \frac{1}{n} (Y_1 + \dots + Y_n).$

• **Theorem**: Suppose $Y_i \sim N(\mu, \sigma^2)$. Then

$$\overline{Y} \sim N\left(\mu, \frac{\sigma^2}{n}\right).$$

• That is, \overline{Y} is normally distributed with mean μ and variance $\frac{\sigma^2}{n}$.

Converting to Standard Normal

• **Recall**: If \overline{Y} is normal, then

$$Z := \frac{\overline{Y} - \text{mean}}{\text{standard deviation}}$$
 is standard normal, that is, $Z \sim N(0, 1)$.

• Corollary to Theorem:

$$Z := \frac{\sqrt{n} \left(\overline{Y} - \mu\right)}{\sigma} \sim N(0, 1)$$

• So we can use charts to find probabilities for Z and then work back to find them for Y.

Example I

Heights of students are normally distributed with a standard deviation of 4 inches. You measure the heights of 9 students. What is the probability that their mean is within 2 inches of the (unknown) global mean?

 $n = 9, \mu =$ unknown, $\sigma = 4.$ $Z := \frac{3(\overline{Y} - \mu)}{4}$ is standard normal.

$$\left|\overline{Y} - \mu\right| \le 2 \text{ iff } \left|\frac{3\left(Y - \mu\right)}{4}\right| \le 1.5$$

From the table on page 848, $P(Z > 1.5) \approx 0.0668$. [Graph the normal curve and shade the tail.]

$$P(Z < -1.5 \text{ or } Z > 1.5) \approx 2 * 0.0668 = 0.1336$$
$$P(-1.5 \le Z \le 1.5) \approx 1 - 0.1336 = 0.8664 \approx \boxed{87\%}$$

Example II

Let Y_1, \ldots, Y_n be i.i.d. variables, with $Y_i \sim N(\mu, \sigma^2)$. If $\sigma^2 = 64$ and n = 36, find the probability that \overline{Y} is within one unit of μ . What happens to this probability as $n \to \infty$?

$$\begin{aligned} \frac{\overline{Y} - \mu}{\frac{\sigma^2}{n}} &= \frac{\overline{Y} - \mu}{\frac{8}{6}} = \frac{3}{4} \left(\overline{Y} - \mu \right) \\ \left| \overline{Y} - \mu \right| &\le 1 \quad \text{iff} \quad \frac{3}{4} \left| \overline{Y} - \mu \right| &\le \frac{3}{4} \\ P &\approx 1 - 2(0.2266) = 1 - 0.4532 = \boxed{0.5468 \approx 55\%} \end{aligned}$$

This $\rightarrow 1$ as $n \rightarrow \infty$.

Example III

Students at a university have taken an average of 70 units, with a standard deviation of 20 units. Assuming this distribution is normal, if you sample 9 students, what is the chance that their average unit total is between 67 and 73 units?

Will Murray's Probability, XXXIV. Sampling from a Normal Population 6

We want $P(|\overline{Y} - \mu| \leq 3)$. We know

$$Z := \frac{\sqrt{n} \left(\overline{Y} - \mu\right)}{\sigma} \sim N(0, 1).$$

 $\sqrt{n} = 3, \sigma = 20$

$$\begin{aligned} \left| \overline{Y} - \mu \right| &\leq 3\\ \frac{3 \left| \overline{Y} - \mu \right|}{20} &\leq \frac{3 \cdot 3}{20} = 0.45\\ P(Z > 0.45) &= 0.3264\\ P(-0.45 < Z < 0.45) &= 1 - 2(0.3264) = 1 - 0.6528 = \boxed{0.3472 \approx 35\%} \end{aligned}$$

Example V

As in Example IV, we plan to sample a normally distributed population with variance 0.67. We want to ensure that our sample mean will be within 0.5 units of the population mean with probability 95%. How many samples should we take?

We want $P\left(\left|\overline{Y} - \mu\right| \le 0.5\right) = 0.95$. We know

$$Z := \frac{\sqrt{n} \left(\overline{Y} - \mu\right)}{\sigma} \sim N(0, 1).$$

Draw the normal curve. We want 95% of the area in the middle, so we want the outer area to be $\frac{1-0.95}{2} = 0.025$. This corresponds by the chart to Z = 1.96.

$$\begin{aligned} \left| \overline{Y} - \mu \right| &\leq 0.5 \\ \left| \frac{\sqrt{n} \left(\overline{Y} - \mu \right)}{\sigma} \right| &\leq \frac{0.5\sqrt{n}}{\sigma} \\ \left| Z \right| &\leq \frac{0.5\sqrt{n}}{\sigma} \\ 1.96 &\leq \frac{0.5\sqrt{n}}{\sigma} \\ \frac{1.96\sigma}{0.5} &\leq \sqrt{n} \\ 3.92\sigma &\leq \sqrt{n} \\ (3.92) \left(\sqrt{0.67} \right) &\leq \sqrt{n} \\ n &\geq \left[(3.92) \left(\sqrt{0.67} \right) \right]^2 \approx 10.296 \\ n &= \boxed{11} \end{aligned}$$
